

Advanced 2D collision detection.

Separating axis theorem (SAT)

How far away are they on X?

$$p = |x_1 - x_2| - \frac{w_1 + w_2}{2}$$

if $p \geq 0$, we are not
colliding!

X axis is the separating axis.

Do the same on the Y-axis with box heights if X is not separating.

If neither axis is separating, we have a collision!

How far away are they on X?

How far away are they on X ?

Get corner points.

$o1 = -width/2$

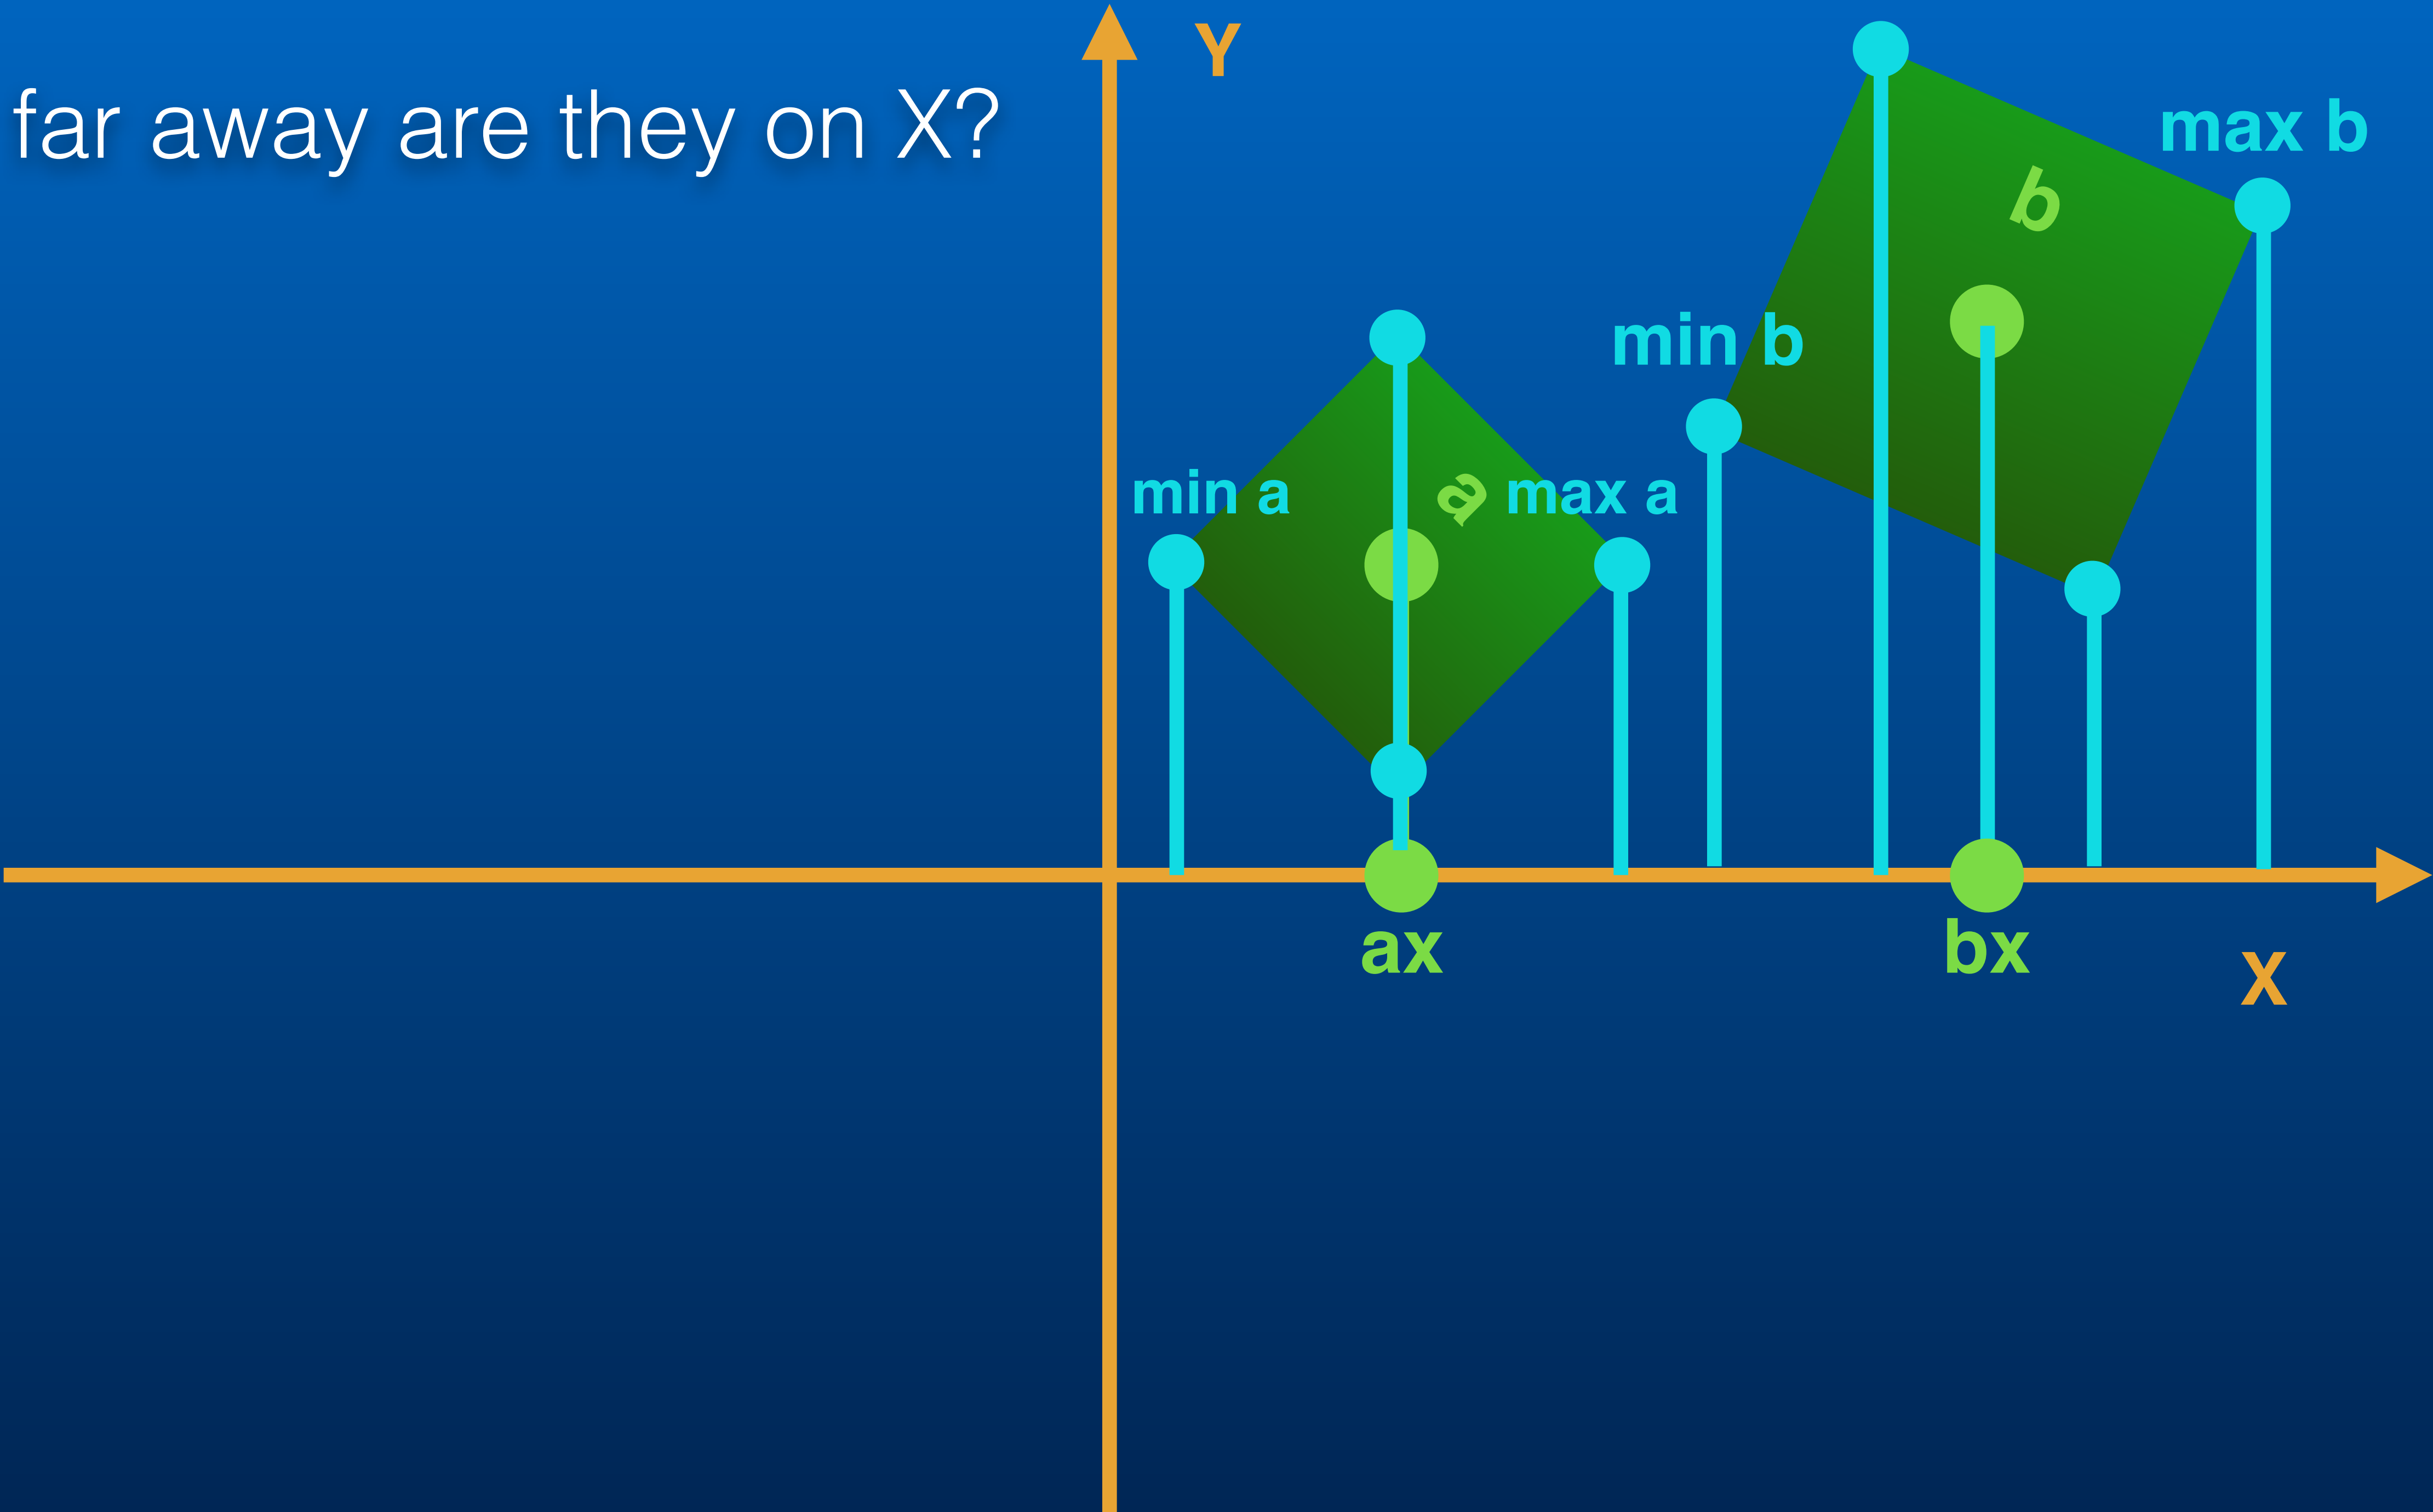

$o1 = (-width/2, height/2)$
 $s1 = b_matrix * o1$

How far away are they on X?

How far away are they on X?

$$p = |x_1 - x_2| - \frac{w_1 + w_2}{2}$$

if $p \geq 0$, we are not
colliding!

How far away are they on X?

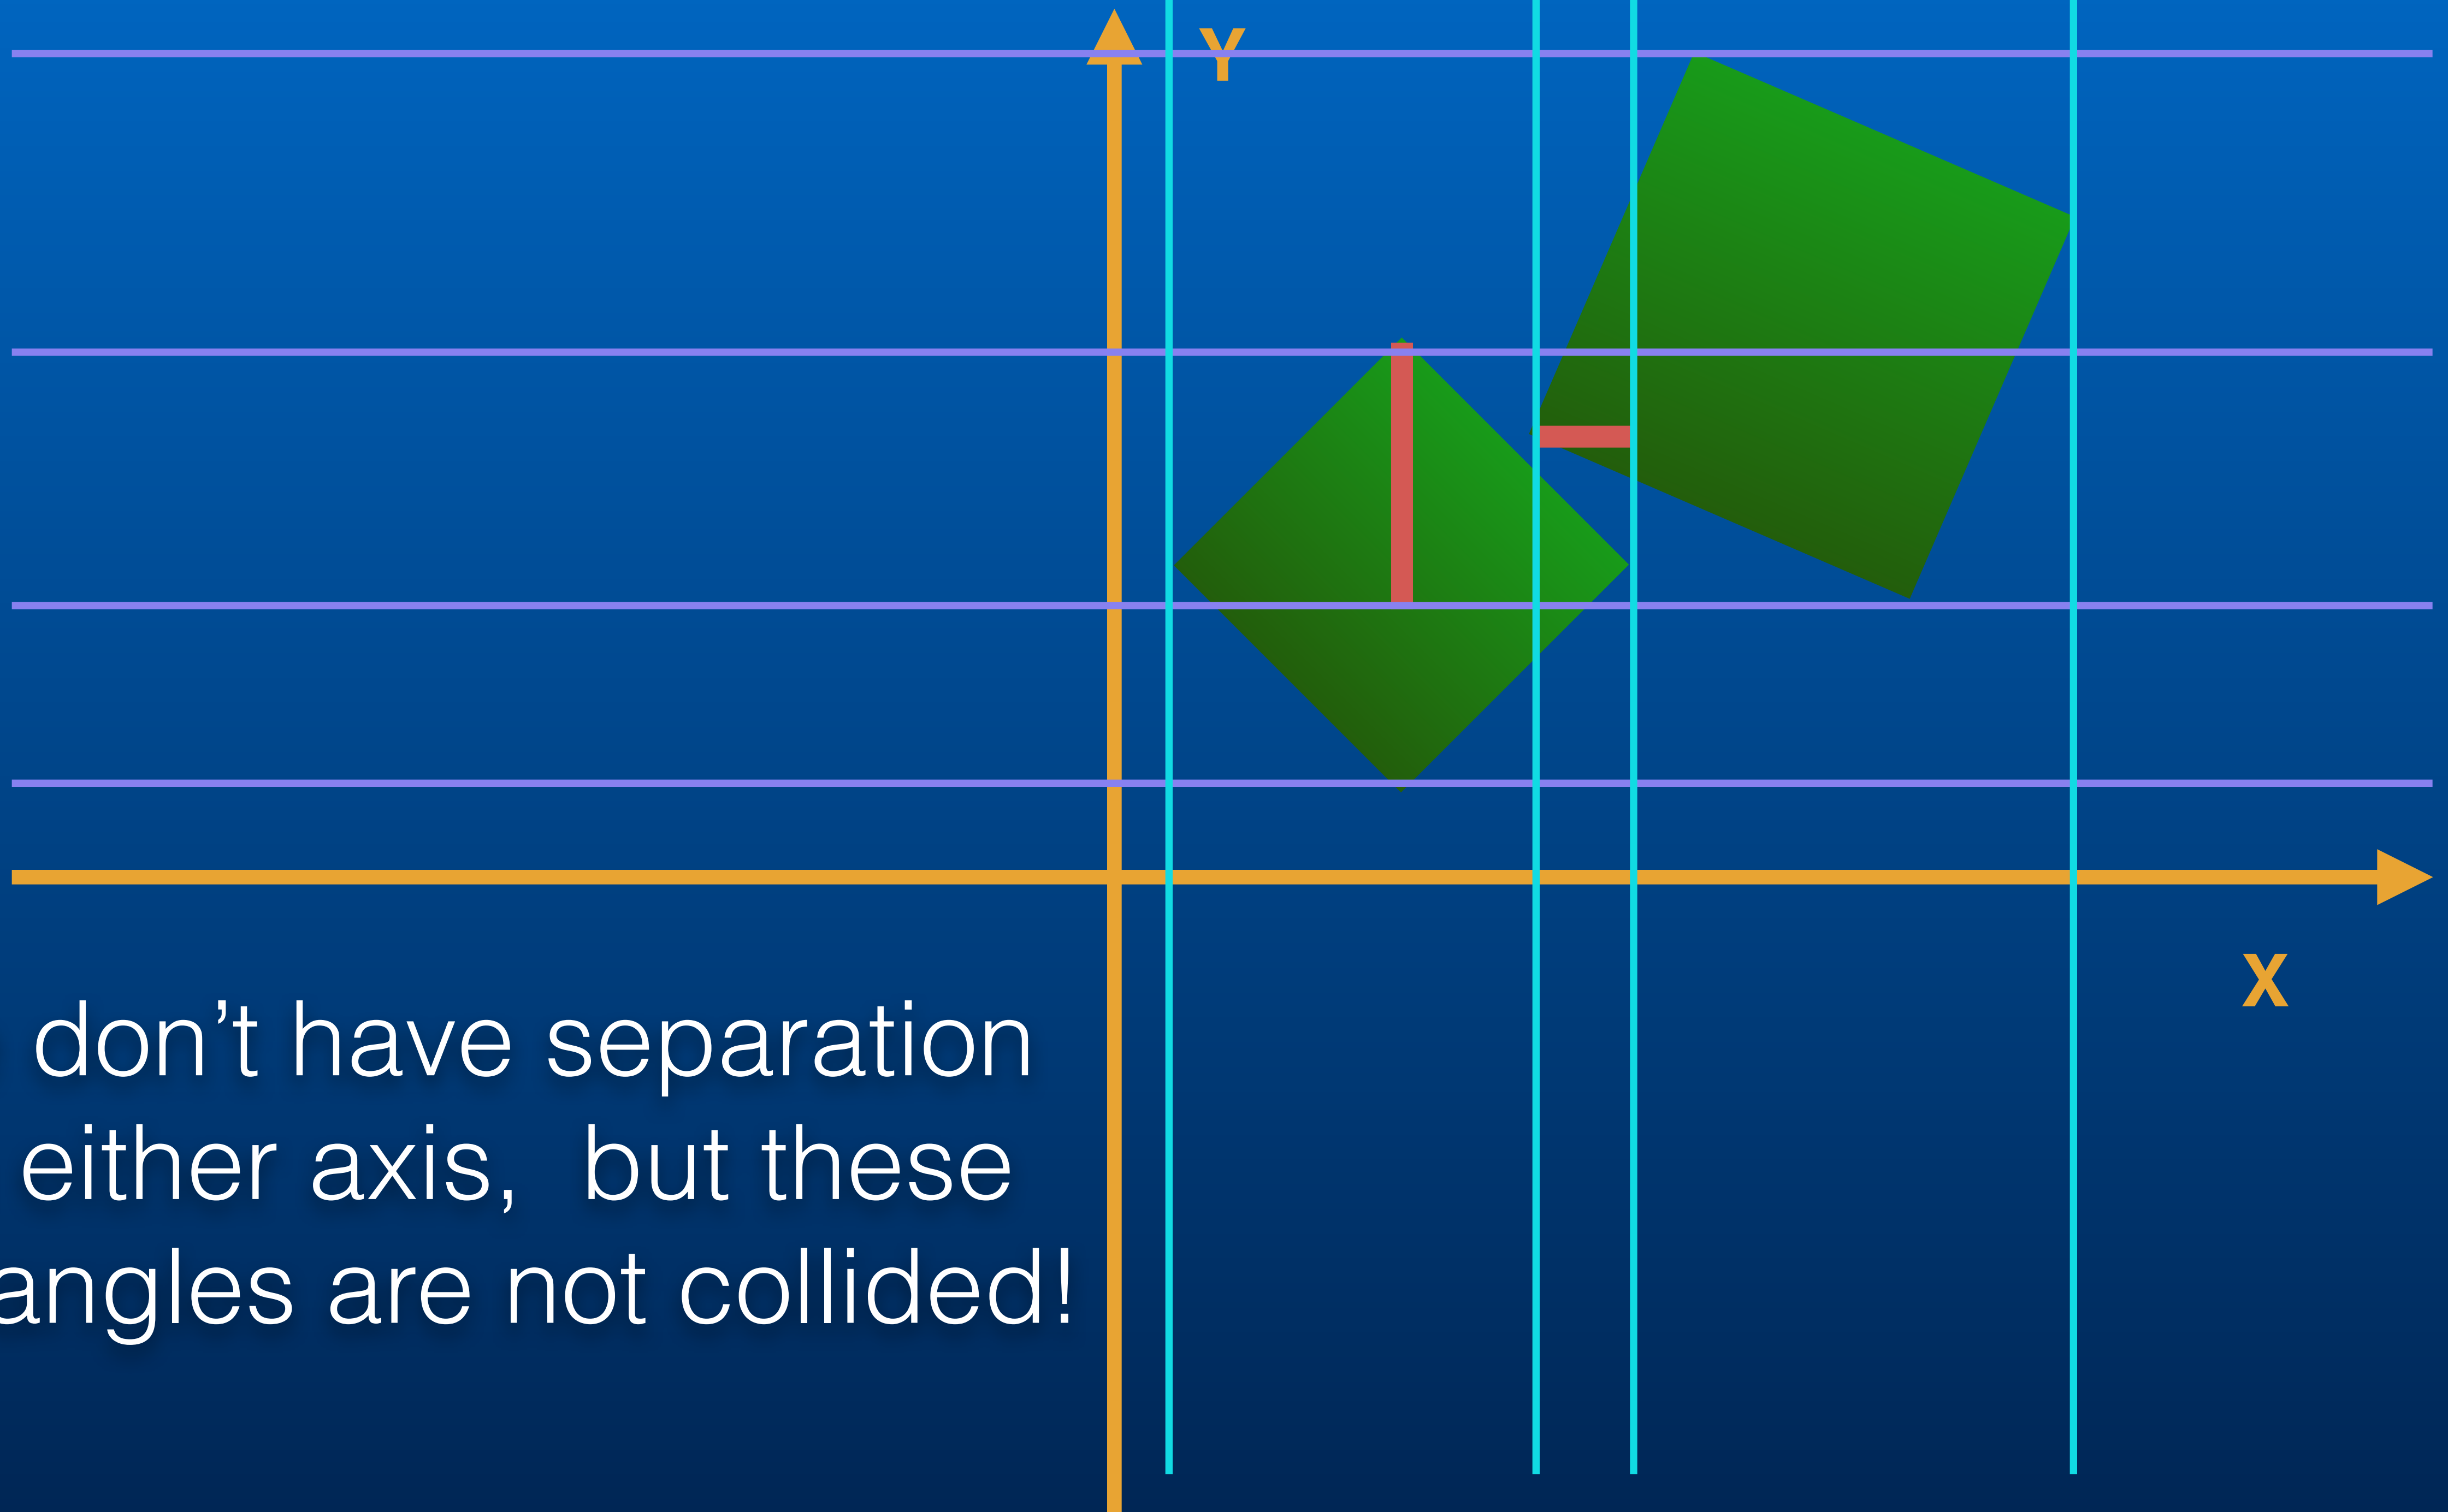

$$p = |x_1 - x_2| - \frac{w_1 + w_2}{2}$$

if $p \geq 0$, we are not
colliding!

We cannot check rotated separation
on X and Y axes!

We don't have separation
on either axis, but these
rectangles are not collided!

We need to check on both axes
of each rectangle.

What is an axis?

An axis is just a unit vector representing a direction.

An axis is just a unit vector representing a direction.

Our usual X axis is $(1.0, 0.0)$ and Y is $(0.0, 1.0)$.

An axis that's at a 45 degree angle ($\pi/4$) can be represented by $(\cos(\pi/4), \sin(\pi/4))$.

How do we figure out our rectangle
axes?

Normals.

Polygon

Polygon edges or sides.

Edge normals.

Normalized (unit) vectors
perpendicular to the edge.

An edge is a vector from one vertex to another.

$$\text{edge_x} = x_2 - x_1$$

$$\text{edge_y} = y_2 - y_1$$

$$\text{edge} = (\text{edge_x}, \text{edge_y})$$

An edge is a vector from one vertex to another.

$$\text{edge_x} = x_2 - x_1$$

$$\text{edge_y} = y_2 - y_1$$

$$\text{edge} = (\text{edge_x}, \text{edge_y})$$

An edge is a vector from one vertex to another.

$$\text{edge_x} = x_2 - x_1$$

$$\text{edge_y} = y_2 - y_1$$

$$\text{edge} = (\text{edge_x}, \text{edge_y})$$

Its normals are the vectors perpendicular to that vector.

$$\text{normal1} = (\text{edge_y}, -\text{edge_x})$$

and

$$\text{normal2} = (-\text{edge_y}, \text{edge_x})$$

Now, normalize the normals.

$\text{length} = \sqrt{x*x + y*y}$

$x /= \text{length}$

$y /= \text{length}$

Our normals are the axes on which we check for separation.

For each edge find the normal.

Projecting onto an arbitrary axis.

The dot product.

$$(x_1 * x_2) + (y_1 * y_2)$$

Applies one vector to another.

$$(2,3) \cdot (1,0) = (2*1) + (3 * 0) = 2$$

$$(2,3) \cdot (0,1) = (2 \cdot 0) + (3 \cdot 1) = 3$$

Normalize (6,4):

$$\text{length} = \sqrt{6*6 + 4*4} = 7.2111$$

$$x = 6 / 7.2111 = 0.832$$

$$y = 4 / 7.2111 = 0.5547$$

$$(2,3) \cdot (0.832, 0.555) = (2*0.832) + (3 * 0.555) \\ = 1.664 + 1.665 = \mathbf{3.329}$$

Normalize (6,4):

$$\text{length} = \sqrt{6*6 + 4*4} = 7.2111$$

$$x = 6 / 7.2111 = 0.832$$

$$y = 4 / 7.2111 = 0.5547$$

$$(2,3) \cdot (0.832,0.555) = (2*0.832) + (3 * 0.555) \\ = 1.664 + 1.665 = \mathbf{3.329}$$

$$(0.832,0.555) * 3.329 = (2.769, 1.847)$$

Find dot product of each corner with the normalized axis vector.

How far away are they on this axis?

$$p = |x_1 - x_2| - \frac{w_1 + w_2}{2}$$

if $p \geq 0$, we are not
colliding!

Check the separation on each of the 4 normal axes (we don't have to check all 8 since 2 sides of each rectangle are parallel).

If on any axis, there is a separation, the collision is not occurring.

Arbitrary polygon collision.

If $aMin \leq bMax$ and $aMax \geq bMin$, we have a collision on this axis

Only works with convex polygons!

(every internal angle < 180 degrees and it's not self intersecting)

Responding to collisions.

If $aMin \leq bMax$ and $aMax \geq bMin$, we have a collision on this axis

FIND THE SMALLER PENETRATION FOR EACH AXIS

OR

$$aMax - bMin \text{ OR } bMax - aMin$$

**THEN TRANSLATE IT BACK INTO WORLD SPACE COORDINATES
BY MULTIPLYING BY THE AXIS NORMAL AND SAVE INTO A LIST**

**OUR ADJUST VECTOR IS THE SMALLEST PENETRATION VECTOR
FROM ALL THE AXES!**

Raycasting.

What is a ray?

A ray has an origin position and a direction.

It can be defined as a two vectors, one defining the position and another (unit!) vector defining the direction.

9mm semi-automatic pistol.

Good against small numbers.

Ray/Polygon intersection test.

```
bool raySegmentIntersect(const Vector &rayOrigin, const Vector &rayDirection, const
Vector &linePt1, const Vector &linePt2, float &dist)
{
    Vector seg1 = linePt1;
    Vector segD;
    segD.x = linePt2.x - seg1.x;
    segD.y = linePt2.y - seg1.y;

    float raySlope = rayDirection.y / rayDirection.x;
    float n = ((seg1.x - rayOrigin.x)*raySlope + (rayOrigin.y - seg1.y)) / (segD.y -
segD.x*raySlope);

    if (n < 0 || n > 1)
        return false;

    float m = (seg1.x + segD.x * n - rayOrigin.x) / rayDirection.x;
    if (m < 0)
        return false;

    dist = m;
    return true;
}
```

Use closest distance.

Assignment.

Make simple asteroids.

- You have two weeks.
- You must use transformation matrices and non-axis-aligned collisions!

Assignment #2.

- Start thinking about your final project.
- Send me your final project idea by next Thursday.
